

Statement of Purpose – Amazon ML Summer School 2026

I got interested in machine learning when I started working with data and realised you can extract meaningful patterns that helps solve some problems. As a Computer Science (Data Science) student, my journey has evolved from basic programming to building machine learning models and understanding how intelligent systems make decisions/ predictions using data.

One of the projects where I learnt a lot of things was an employee salary prediction system. During this project, I prepared the data, performed feature selection by applying ML algorithms including Logistic Regression, Random Forest and Gradient Boosting models to train it and then evaluate its performance. I also deployed the project using Streamlit, which taught me that building a model is one thing but then deploying it into something workable and usable for end users is another.

Apart from this, I have worked on academic assignments involving neural networks for both classification and regression tasks. Implementing models with different activation functions and analyzing their performance gave me practical exposure to concepts such as loss functions, optimization, overfitting, and model evaluation. These experiences strengthened my understanding of machine learning fundamentals and motivated me to explore the field further.

Besides this, I have also worked on some academic assignments involving neural networks for classification and regression tasks. It provided me practical exposure to loss functions, optimization, overfitting and model evaluation through implementation of different models with varied activation functions. All these experiences fortified my basic knowledge of machine learning and inspired me to deepen into this field.

Amazon's Machine Learning Summer School (Amazon ML Summer School) aligns perfectly with my development goals. Studying under researchers and engineers who solve real-world problems will allow me to gain unique insights that cannot be obtained in traditional classroom settings. This opportunity will also enable me to bridge the gap between industry and academia, and access cutting-edge technologies for large-scale systems.

I possess two core qualities well-suited to this project: a willingness to pursue active learning, and a consistent habit of translating theoretical knowledge into practical application. When learning new information, I always deepen my understanding through hands-on project practice. This process has helped me build my problem-solving abilities and develop a genuine interest in machine learning. If I am admitted to the camp, I will learn from field experts, interact with like-minded peers, and take the initiative to contribute to all relevant discussions and activities.

I see Amazon ML Summer School as an important step in my journey toward becoming a machine learning engineer. The knowledge, mentorship, and exposure offered by the program will help me build a stronger foundation and prepare me for future challenges in the field of AI and machine learning.
